- Appendix

Executive Summary

- **Summary of Methodologies:**

- Data collection through API
- Data collection with Web Scraping
- Data Wrangling
- EDA with SQL
- EDA using Pandas and Matplotlib
- Interactive Visual Analytics and Dashboard
- Predictive Analysis(Classification)

- **Summary of all Results:**

- EDA Results
- Interactive Visual Analytics and Dashboard(Screenshots)
- Predictive Analysis Results(ML)

Introduction

- SpaceX advertises Falcon 9 rocket launches on its website, with a cost of 62 million dollars; other providers cost upward of 165 million dollars each, much of the savings is because SpaceX can reuse the first stage. The majority of these savings can be attributed to SpaceX's brilliant idea to reuse the launch's first stage by re-landing the rocket for the following flight. The price will decrease considerably more if this method is repeated. The objective of my project, which I am working on as a data scientist for a firm that competes with SpaceX, is to build a machine learning pipeline to forecast how the first stage will land in the future. The success of this initiative will determine how much to offer SpaceX for a rocket launch.
- **Objective :**
- Discover all factors that influence the landing outcome.
- The relationship between each variables and how it is affecting the target Variable.
- The best Possibility needed to increase the probability of successful landing.

Section 1

Methodology

Methodology

Executive Summary

- Data collection methodology : Data was collected using SpaceX REST API and web scrapping from Wikipedia
- Perform data wrangling : Data was processed using one-hot encoding for categorical features
- Perform exploratory data analysis (EDA) using visualization and SQL
- Perform interactive visual analytics using Folium and Plotly
- Perform predictive analysis using classification models : How to build, tune, evaluate classification models

Data Collection

- Data collection is the process of gathering and measuring information on specific variables in an established system, allowing one to answer pertinent questions and evaluate outcomes. As previously stated, the dataset was obtained from Wikipedia via REST API and web scraping.
- For REST API, it begins with a get request. The response content was then decoded as Json and converted into a pandas dataframe using `json normalize ()`. We then cleaned the data, looked for missing values, and filled in the gaps.
- We will use BeautifulSoup for web scraping to extract the launch records as an HTML table, parse the table, and convert it to a pandas dataframe for further analysis.

<https://github.com/Mohammed-Mujahid9036/Data-Science-Capstone-Project/blob/main/jupyter-labs-spacex-data-collection-api.ipynb>

Data Collection - SpaceX API

- Get request for rocket launch data using API
- ↓
- Use `json_normalize` method to convert json result to dataframe
- ↓
- Performed data cleaning and filling the missing value.

<https://github.com/Mohammed-Mujahid9036/Data-Science-Capstone-Project/blob/main/jupyter-labs-spacex-data-collection-api.ipynb>

Data Collection – Scrapping

- Request the Falcon9 Launch Wiki page from url

- Create a BeautifulSoup from the HTML response

- Extract all column/variable names from the HTML header.

<https://github.com/Mohammed-Mujahid9036/Data-Science-Capstone-Project/blob/main/jupyter-labs-webscraping.ipynb>

Data Wrangling

- The process of cleaning and unifying messy and complex data sets for easy access and Exploratory Data Analysis is known as data wrangling (EDA).
- We will first compute the number of launches on each site, followed by the number and frequency of mission outcomes per orbit type.
- The outcome column is then used to generate a landing outcome label. This will make further analysis, visualization, and machine learning easier.

<https://github.com/Mohammed-Mujahid9036/Data-Science-Capstone-Project/blob/main/labs-jupyter-spacex-Data%20wrangling.ipynb>

EDA with Data Visualization

- We first started by using scatter graph to find the relationship between the attributes such as between:
- Payload and Flight Number.
- Flight Number and Launch Site.
- Payload and Launch Site.
- Flight Number and Orbit Type.
- Payload and Orbit Type.
- Scatter plots demonstrate the interdependence of attributes. Once a pattern is discovered in the graphs. It is very clear which factors have the greatest influence on the success of landing outcomes.

<https://github.com/Mohammed-Mujahid9036/Data-Science-Capstone-Project/blob/main/eda-data-viz.ipynb>

EDA with SQL

- We ran many SQL queries to gain a better understanding of the dataset, for example:
 - - Displaying the names of the launch sites.
 - - Displaying 5 records where launch sites begin with the string 'CCA'.
 - - Displaying the total payload mass carried by booster launched by NASA (CRS).
 - - Displaying the average payload mass carried by booster version F9 v1.1.
 - - Listing the date when the first successful landing outcome in ground pad was achieved.
 - - Listing the names of the boosters which have success in drone ship and have payload mass greater than 4000 but less than 6000.
 - - Listing the total number of successful and failure mission outcomes.
 - - Listing the names of the booster_versions which have carried the maximum payload mass.
 - - Listing the failed landing_outcomes in drone ship, their booster versions, and launch sites names for in year 2015.
 - - Rank the count of landing outcomes or success between the date 2010-06- 04 and 2017-03-20, in descending order.

https://github.com/Mohammed-Mujahid9036/Data-Science-Capstone-Project/blob/main/jupyter-labs-eda-sql-coursera_sqllite.ipynb

Build an Interactive Map with Folium

- **Launch Sites Locations**
- **Analysis with Folium:**
 - Marked all launch sites on a map
 - Marked the success/failed launches for each site on the map
 - Calculated the distances between a launch site to its proximities

https://github.com/Mohammed-Mujahid9036/Data-Science-Capstone-Project/blob/main/lab_jupyter_launch_site_location.ipynb

Build a Dashboard with Plotly Dash

- We built an interactive dashboard with Plotly dash which allowing the user to play around with the data as they need.
- We plotted pie charts showing the total launches by a certain sites.
- We then plotted scatter graph showing the relationship with Outcome and Payload Mass (Kg) for the different booster version.

https://github.com/Mohammed-Mujahid9036/Data-Science-Capstone-Project/blob/main/spacex_dash_app.py

Predictive Analysis (Classification)

- **Building the Model** - Load the dataset into NumPy and Pandas , Transform the data and then split into training and test datasets, Decide which type of ML to use, set the parameters and algorithms to GridSearchCV and fit it to dataset.
- **Evaluating the Model** - Check the accuracy for each model, get tuned hyperparameters for each type of algorithms, plot the confusion matrix.
- **Improving the Model** - Use Feature Engineering and, Algorithm Tuning.
- **Find the Best Model** - The model with the best accuracy score will be the best performing model.

[https://github.com/Mohammed-Mujahid9036/Data-Science-Capstone-Project/blob/main/SpaceX Machine%20Learning%20Prediction Part 5.ipynb](https://github.com/Mohammed-Mujahid9036/Data-Science-Capstone-Project/blob/main/SpaceX%20Machine%20Learning%20Prediction%20Part%205.ipynb)

Results

The results will be categorized to 3 main results which is:

- Exploratory data analysis results
- Interactive analytics demo
- Predictive analysis results

The background of the slide is an abstract composition. It features a dark blue gradient on the left side, which transitions into a complex pattern of diagonal streaks and lines in shades of blue, red, and teal on the right. These streaks have a textured, almost woven appearance, suggesting a digital or data-driven theme. The overall effect is dynamic and modern.

Section 2

Insights drawn from EDA

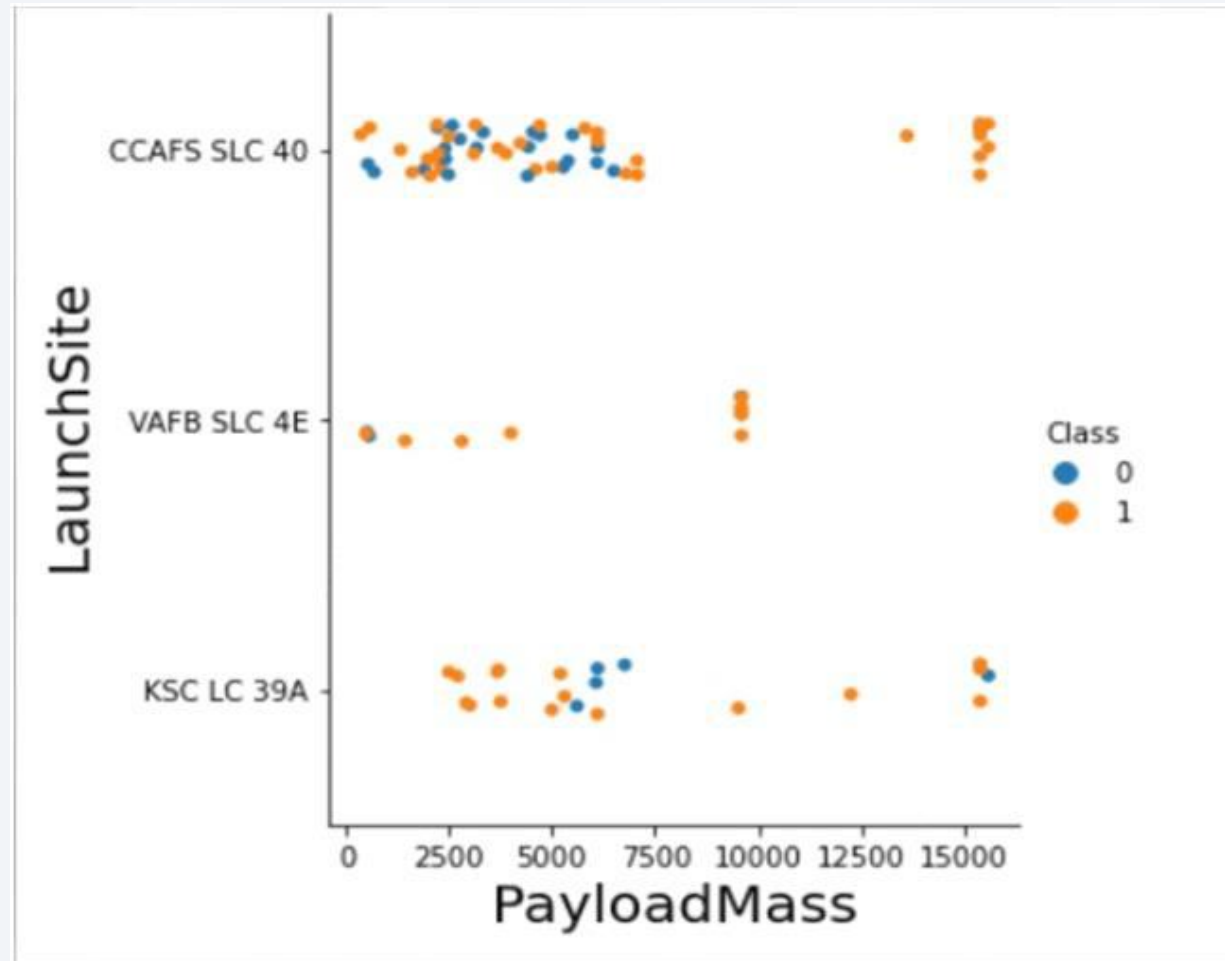

Flight Number vs. Launch Site

- This scatter plot shows that the greater the number of flights from the launch site, the higher the success rate.
- CAFS SLC40, on the other hand, exhibits the least pattern of this.

Payload vs. Launch Site

- This scatter plot shows that once the payload mass exceeds 7000kg, the probability of success increases dramatically.
- However, there is no clear pattern indicating that the success rate of the launch site is dependent on the payload mass.

Success Rate vs. Orbit Type

- This bar chart depicted the possibility of orbits influencing landing outcomes, as some orbits have a 100% success rate, such as SSO, HEO, GEO, and ES-L1, while SO orbit has a 0% success rate.
- However, deeper analysis show that some of these orbits has only 1 occurrence such as GEO, SO, HEO and ES-L1 which mean this data need more dataset to see pattern or trend before we draw any conclusion.

Flight Number vs. Orbit Type

- This scatter graph indicates that, in general, the greater the number of flights on each orbit, the higher the success rate (especially on LEO orbit), except for GTO orbit, which shows no relationship between both attributes.
- Orbits with only one occurrence should also be excluded from the preceding statement, as more data is required.

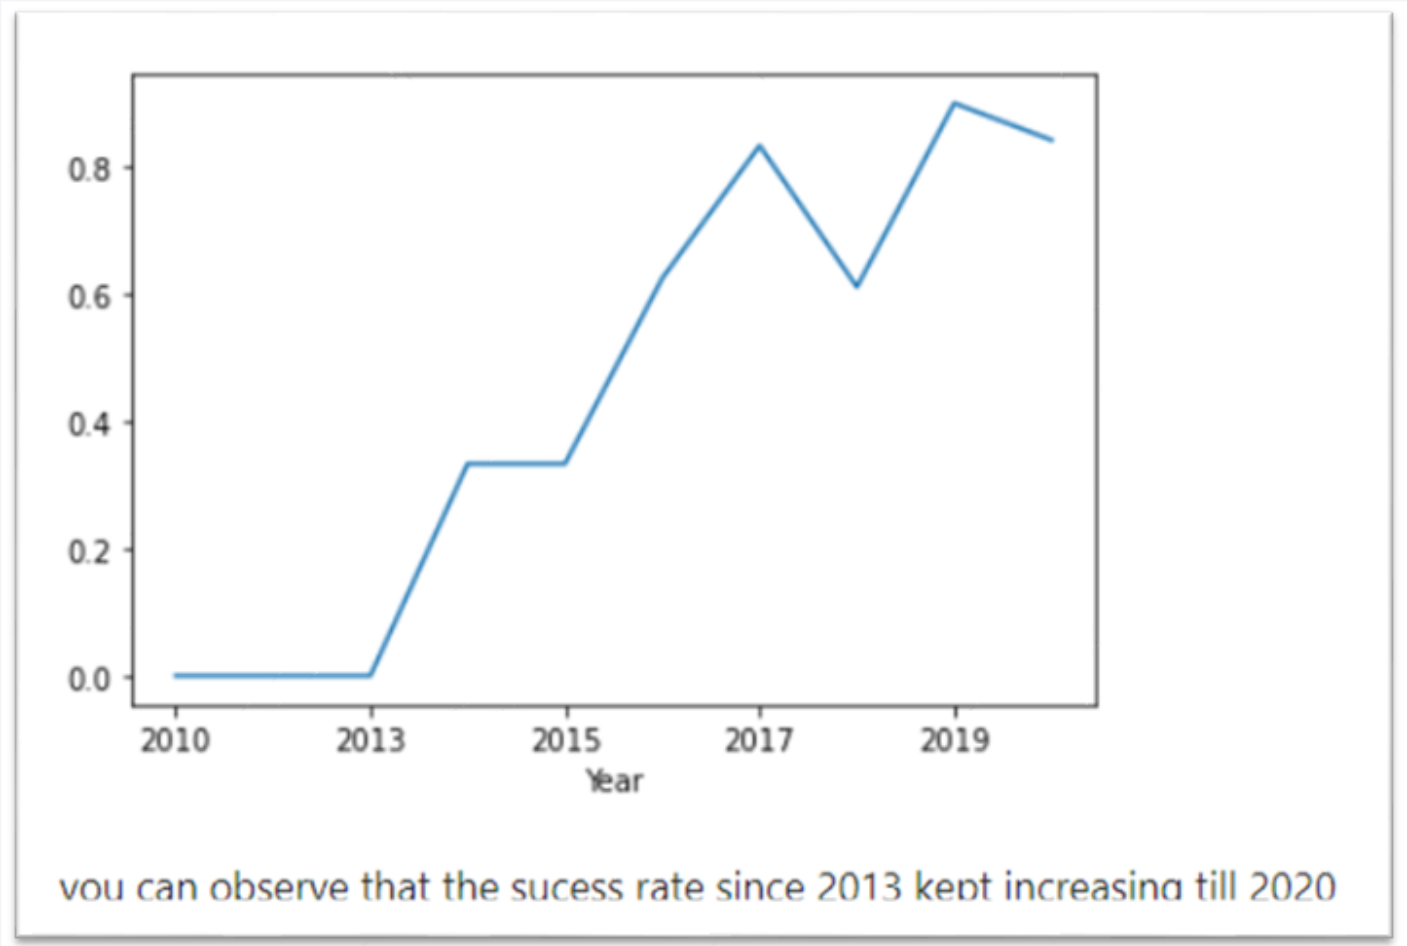

Payload vs. Orbit Type

- A heavier payload benefits LEO, ISS, and PO orbit.
- It does, however, have a negative impact on MEO and VLEO orbit.
- The GTO orbit appears to show no relationship between the attributes.
- Meanwhile, the SO, GEO, and HEO orbits require more data to detect any pattern or trend.

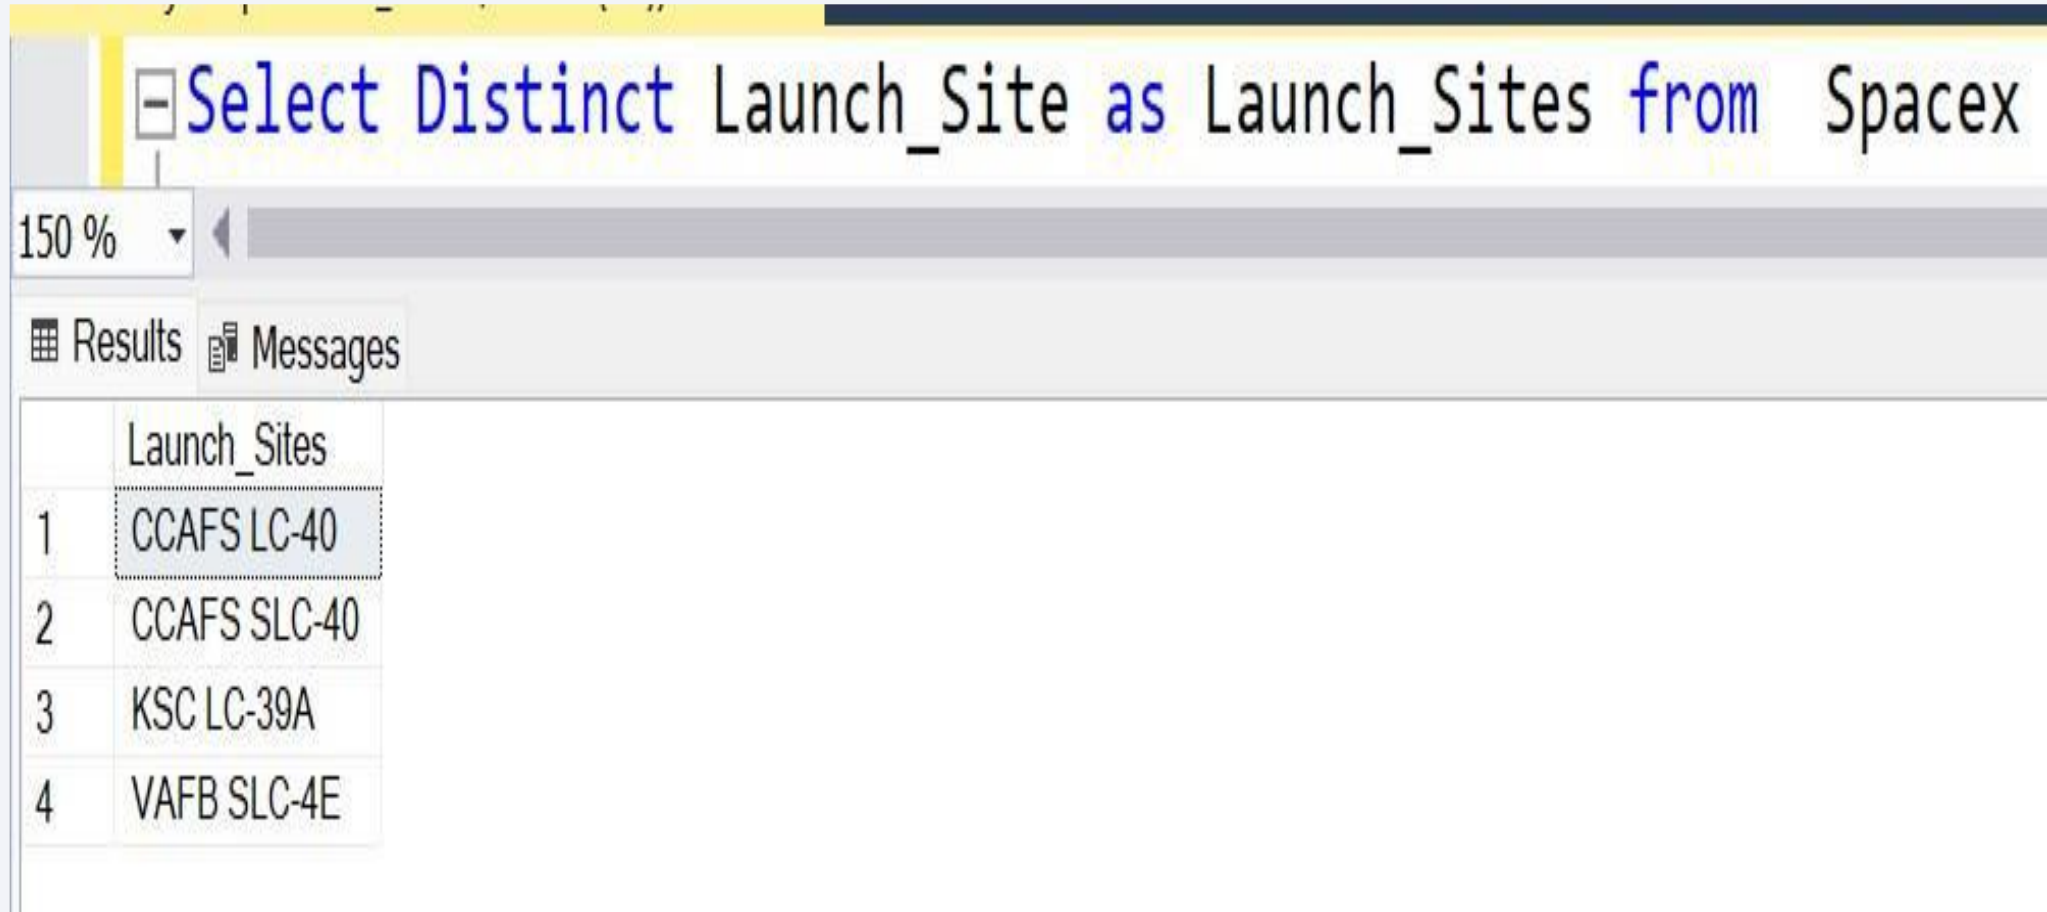

Launch Success Yearly Trend

- If this trend continues in the coming year. The success rate will gradually increase until it reaches 100%.

All Launch Site Names

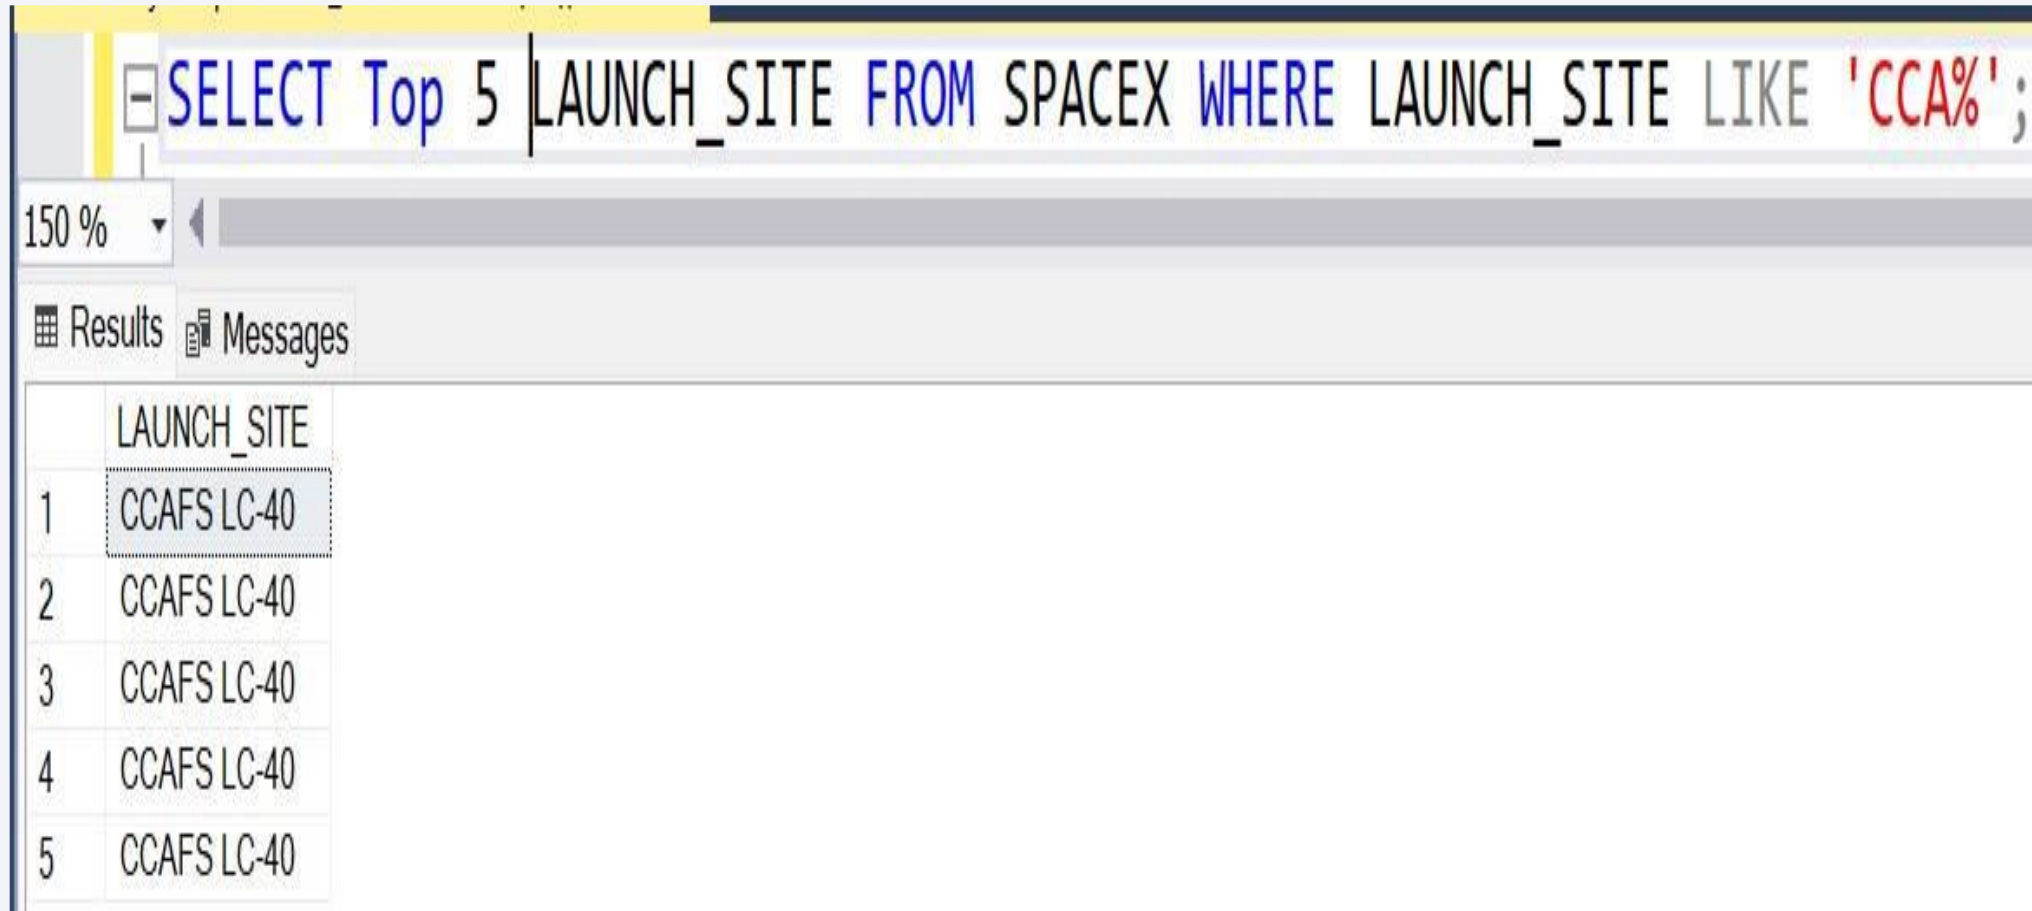

The screenshot shows a SQL query editor with a query window at the top and a results pane below it. The query is: `Select Distinct Launch_Site as Launch_Sites from SpaceX`. The results pane shows a table with one column, `Launch_Sites`, and four rows of data. The first row is highlighted with a dotted border.

A satellite view of Earth from space, showing the curvature of the planet and city lights at night. The background is a deep blue gradient.

Section 3

Launch Sites Proximities Analysis

Interactive Map with Folium

Location of all the Launch Sites

We can see that all the SpaceX launch sites are located inside the United States

Interactive Map with Folium

Markers showing Success & Failure

Red color indicates failure and Green indicates Success

Interactive Map with Folium

Distance from Launch Sites to Landmarks

Are launch sites in close proximity to railways? **NO**

Are launch sites in close proximity to highways? **NO**

Are launch sites in close proximity to coastline? **YES**

Do launch sites keep certain distance away from cities? **YES**

The background of the slide is a close-up, artistic photograph of a printed circuit board (PCB). The board is dark, and the intricate circuit traces are highlighted in a vibrant, glowing red. Numerous small, circular components, likely solder joints or micro-components, are visible along the traces, some of which also appear to be glowing. The overall effect is a high-tech, digital aesthetic.

Section 4

Build a Dashboard with Plotly Dash

Interactive Dashboard with Plotly Dash

Total Successful Launch by all sites

As you can see KSC LC-39A has maximum number of lunches i.e.41.7%

Interactive Dashboard with Plotly Dash

The highest launch-success ratio: KSC LC-39A

KSC LC-39A has 76.9% success rate and 23.1% failure

Interactive Dashboard with Plotly Dash

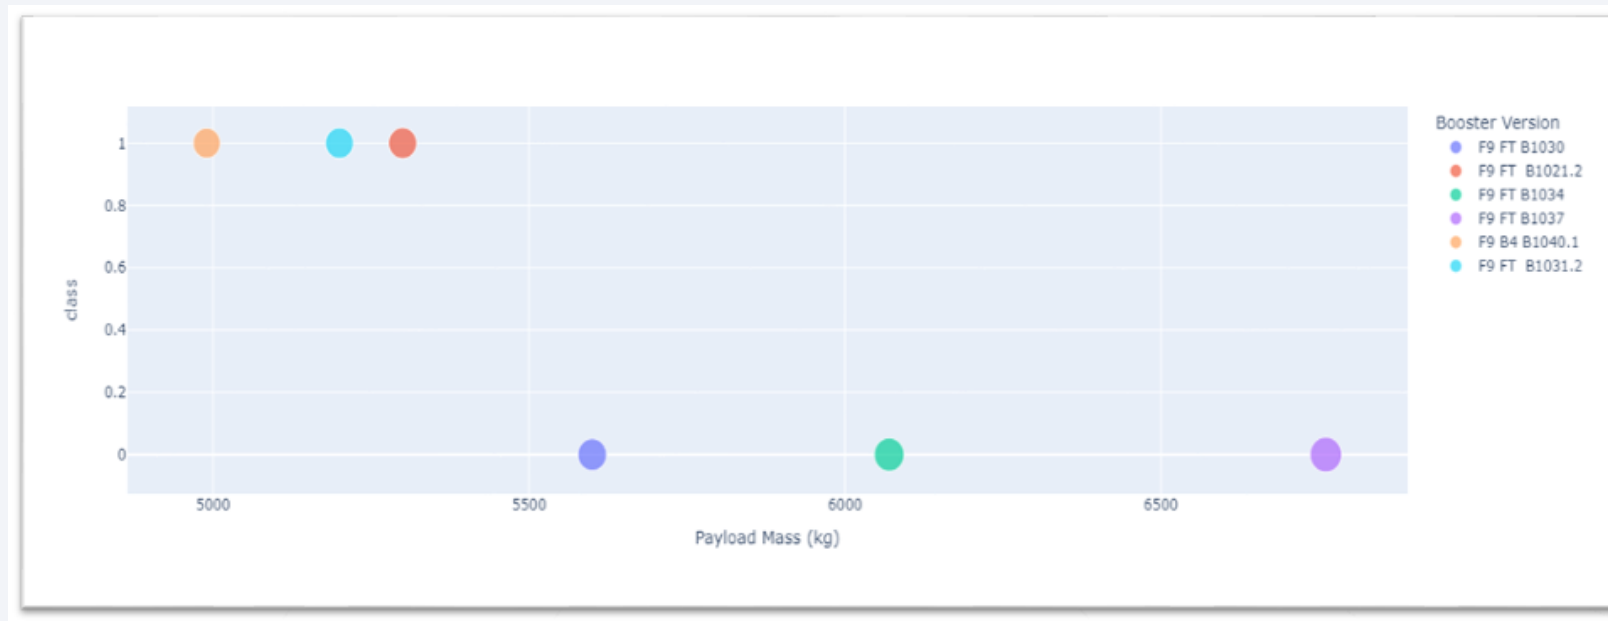

Payload vs Launch Outcome

Payload Mass in range 0 to 4000

Interactive Dashboard with Plotly Dash

Payload vs Launch Outcome

Payload Mass above 4000

Section 5

Predictive Analysis (Classification)

Classification Accuracy

As we can see, by using the code as below: we could identify that the best algorithm to be the Tree Algorithm which have the highest classification accuracy.

```
[16]: print("tuned hpyerparameters :(best parameters) ",logreg_cv.best_params_)  
      print("accuracy :",logreg_cv.best_score_)  
  
      tuned hpyerparameters :(best parameters) {'C': 0.01, 'penalty': 'l2', 'solver': 'lbfgs'}  
      accuracy : 0.8464285714285713
```

```
[21]: print("tuned hpyerparameters :(best parameters) ",svm_cv.best_params_)  
      print("accuracy :",svm_cv.best_score_)  
  
      tuned hpyerparameters :(best parameters) {'C': 1.0, 'gamma': 0.03162277660168379, 'kernel': 'sigmoid'}  
      accuracy : 0.8482142857142856
```

```
[26]: print("tuned hpyerparameters :(best parameters) ",tree_cv.best_params_)  
      print("accuracy :",tree_cv.best_score_)  
  
      tuned hpyerparameters :(best parameters) {'criterion': 'entropy', 'max_depth': 2, 'max_features': 'sqrt', 'min_samples_leaf': 4, 'min_samples_split': 10, 'splitter': 'best'}  
      accuracy : 0.8892857142857145
```

```
[31]: print("tuned hpyerparameters :(best parameters) ",knn_cv.best_params_)  
      print("accuracy :",knn_cv.best_score_)  
  
      tuned hpyerparameters :(best parameters) {'algorithm': 'auto', 'n_neighbors': 10, 'p': 1}  
      accuracy : 0.8482142857142858
```

Confusion Matrix

The confusion matrix for the decision tree classifier demonstrates that the classifier can differentiate between the various classes. The main issue is false positives. i.e., the classifier considers an unsuccessful landing to be a successful landing.

Conclusions

- For this dataset, the Tree Classifier Algorithm is the best Machine Learning approach.
- Low weighted payloads (defined as 4000kg and below) outperformed heavy weighted payloads.
- Since 2013, the success rate of SpaceX launches has increased in direct proportion to the time elapsed between 2013 and 2020, with the goal of eventually perfecting the launches in the future.
- KSC LC-39A has had the most successful launches of any site, with 76.9% success rate.
- The SSO orbit has the highest success rate; 100% with more than one occurrence.

Thank you!
